Single-Axis Robot ISA/ISPA Series Features

The ISA/ISPA is a high-precision positioning system comprised of a base, linear guides, ball screw and AC servo motor. It achieves cost savings, because its design is more comprehensive and adjustment is much easier than when individual components are purchased and assembled.

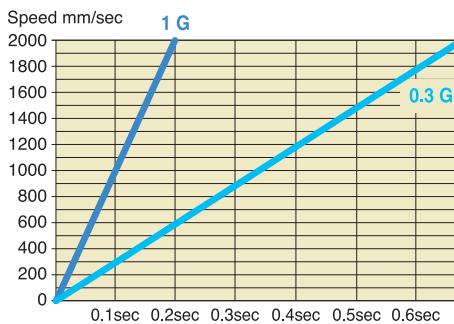

1 Higher Maximum Acceleration/Deceleration of 1 G (9800 mm/sec²)

Both the ISA and ISPA achieve a maximum acceleration/deceleration of 1 G, which was heretofore possible only with the ISP Series.

* When accelerating to 2000 mm/sec, a robot operating at an acceleration of 1 G achieves the target speed approx. 0.5 second faster than a robot operating at an acceleration of 0.3 G (as shown in the graph at right).

Acceleration/deceleration indicates the rate of change of speed. 1 G is equivalent to 9800 mm/sec², or the ability to accelerate (or decelerate) 9800 mm/sec per second.

■ Comparison of Acceleration Time at 1 G and 0.3 G

2 Dedicated X/Y/Z-Axes

Dedicated axes are available to choose from according to your specific need.

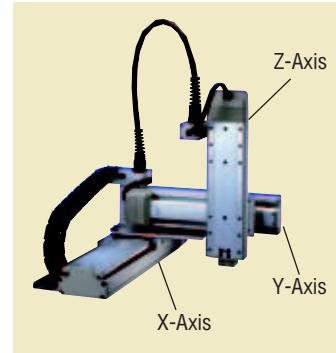

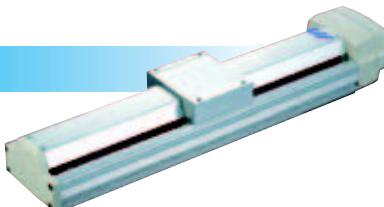

X-Axis Type (SXM, MXM, LXM, etc.)

- A dedicated cover prevents intrusion of small parts and other foreign objects from above.
- To install the actuator, open the cover and affix with bolts from above.

Y-Axis Type (SYM, MYM, LYM, etc.)

- A cover shape is adopted to prevent intrusion of small parts and other foreign objects from above when the actuator is installed on its side.

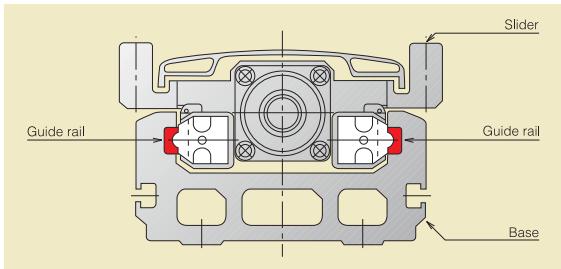

Z-Axis Type (SZM, MZM, LZM, etc.)

- The actuator comes standard with a slider anti-drop brake by assuming use in a vertical application.
 - The mounting holes provided in the back of the base (actuator-mounting surface) are different from the mounting holes of the X-axis type.
- (A load can be attached easily to the base surface when the actuator is moved vertically.)

3 Achieving Higher Rigidity with Smaller Size via Base-Integrated Guide Structure

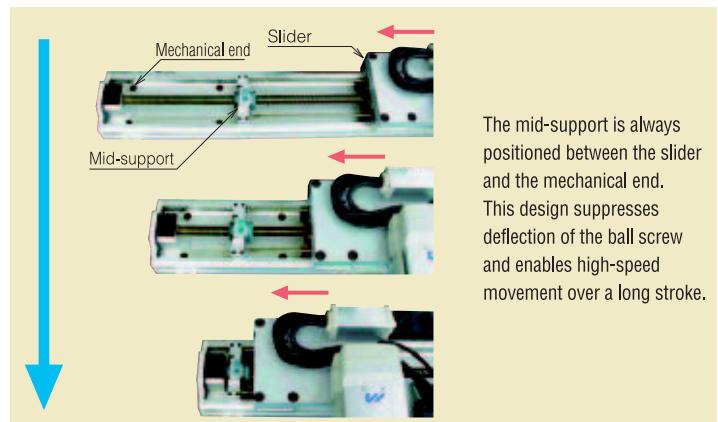

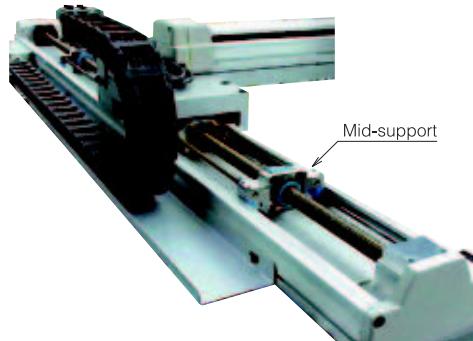

The thickness of the actuator has been reduced by embedding the guide rails in the base. The base also employs a hollow box structure for improved rigidity.

4 2500-mm Stroke with Ball Screw, Achieved with Mid-Support Mechanism

A ball screw drive actuator is prone to screw deflection when the stroke is increased, which makes it difficult to increase the rotating speed and therefore the actuator speed. As a result, belt drive has been the mainstream drive mechanism for long-stroke actuators.

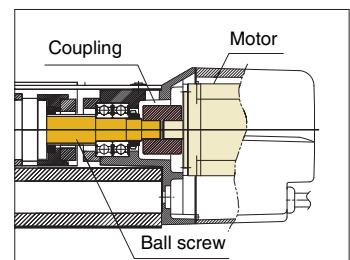

The ISA/ISPA Series achieves a long stroke of 2500 mm using a ball screw drive, employing an original (patented) mid-support mechanism.

5 Direct Coupling Structure at Same Overall Length as Integrated Ball Screw Type

The ISA/ISPA Series features a coupling structure of the same overall length as the conventional IS Series (integrated ball screw type).

This structure allows for motor replacement in the event of a motor problem.

6 Selectable Controller Depending on Desired Control Method

The following three controller types are available:

1 Program Operation X-SEL	2 Program/Positioner Operation S-SEL	3 Positioner/Pulse-train operation E-CON/S-CON

Single-Axis Robot Series **Points to Note****Notes on Catalog Specifications****Speed**

"Speed" refers to the specified speed at which the actuator slider will move. The slider accelerates from a stationary state, and once the specified speed is reached it will maintain that speed until the specified position (immediately before the target position), where it will begin decelerating to stop at the target position.

< Caution >

- ① The maximum speed of the ISA/ISPA Series will remain the same even when the load placed on the slider is changed.
- ② The time needed to reach the specified speed will vary according to the acceleration (deceleration).
- ③ If the travel distance is short, the specified speed may not be reached.
- ④ With a long-stroke axis, the maximum speed will drop to avoid reaching a dangerous speed.
(If you are using a 600 or longer stroke, check the maximum speed for the applicable stroke in the corresponding dimensional drawing.)
- ⑤ When calculating the travel time, consider acceleration, deceleration and stabilization periods in addition to the travel time at the specified speed. (Refer to pages 39 and 40 for the method to calculate travel time.)
- ⑥ Speed can be set in increments of 1 mm/sec in a program.

**Acceleration/
Deceleration**

"Acceleration" refers to the rate of change of speed when the speed rises from zero (stationary state) to the specified speed.

"Deceleration" refers to the rate of change of speed when the specified speed drops to zero (stationary state).

< Caution >

- ① Increasing the acceleration (deceleration) will shorten the duration the actuator accelerates (decelerates) and decrease the travel time. However, doing so will also cause rapid acceleration (deceleration), resulting in increased shock.
- ② The rated acceleration is 0.3 G (or 0.15 G if the lead is 4 or 5 mm).
(The load capacity is set based on the rated acceleration.)
- ③ If the ISA/ISPA Series is operated at an acceleration (deceleration) exceeding the rated acceleration, the load capacity will drop.
(Refer to page 40 for details.)
- ④ Acceleration can be set in increments of 0.01 G in a program.

Duty

IAI recommends that our actuators be used at a duty of 50% or less as a guideline in view of the relationship of service life and accuracy.

$$\text{Duty (\%)} = \frac{\text{Motion time}}{\text{Motion time} + \text{Inactivity}} \times 100$$

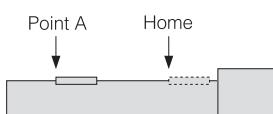

**Positioning
Repeatability**

"Positioning repeatability" refers to the positioning accuracy of repeated movements to a pre-stored position.

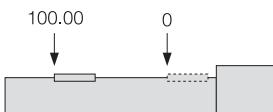

This is not the same as "absolute positioning accuracy," so exercise caution.

Positioning repeatability

Accuracy variation of the stop position when positioning is performed repeatedly to the same point.

**Absolute positioning accuracy**

Difference between the coordinate value and the measured value when positioning is performed to a given positioning point specified by coordinates.

Single-Axis Robot Series Points to Note

Notes on Catalog Specifications

Home

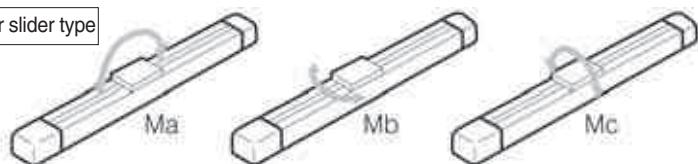

The home is set on the motor side for the standard specification, or on the counter-motor side for the reversed-home specification.

- The incremental actuator always requires homing every time the power is reconnected.
- During homing the slider will move to the mechanical end before reversing, so be careful to prevent contact with surrounding parts.
- To change the home direction, the controller parameters must be changed.

Allowable Load Moments (Ma, Mb, Mc)

Each allowable load moment is calculated by assuming the service life of the guide as 10,000 km. Applying a moment exceeding the specified value will reduce the life of the guide, so exercise caution.

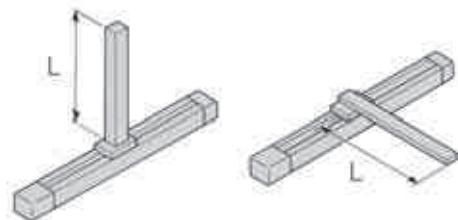

Directions of load moment for slider type

Overhung Load Length (L)

"Overhung load length" refers to a reference offset at which the actuator can operate smoothly when a load, bracket, etc., is installed at a position offset from the actuator/slider center.

When each model is used with an overhung load exceeding the allowable length, vibration or stabilization delay may result. Therefore, be sure to keep the overhung load length within the allowable value.

Actuator Accuracy

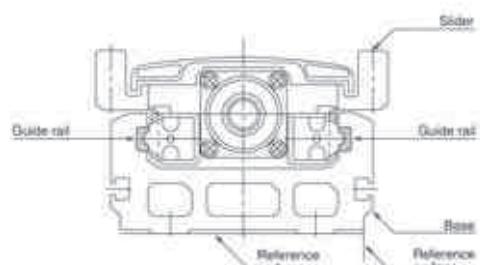

The accuracy of the ISA/ISPA-Series actuators is specified below.

The side and bottom faces of the actuator base provide reference surfaces for slider travel. Use them to adjust parallelism when installing the actuator.

and load-mounting surface (top face)
±0.05 mm/m or less

Parallelism when mounted on frame (when the actuator is mounted to a flat surface *)
±0.05 mm/m or less

Condition: The above values are applicable at 20°C. * Flatness: 0.05 mm or less

Explanation of Model Specification Items

Refer to the right page for the explanation of each model specification item.

The selection range for each item will vary depending on the actuator type. For details, refer to the page corresponding to each actuator type.

T1
T2

(1) Series

Indicate the name of each series.

(2) Type

Indicate the classification by size (S, M, L or W), shape (X, Y or Z), etc.

(3) Encoder type

Indicate whether the encoder installed in the actuator is an "absolute type" or "incremental type."

A: Absolute type

Since the current slider position will be retained after the power is turned off, homing is not required when the actuator is powered up.

I: Incremental type

Since the slider position data are cleared when the power is turned off, homing must be performed every time the actuator is powered up.

(4) Motor output

Indicate the output of the motor installed in the actuator in watts.

(6) Stroke

Indicate the actuator stroke (range of operation) in millimeters.

(8) Cable length

Indicate the length of the motor/encoder cable connecting the actuator and the controller.

N : No cable

S : 3m

M : 5m

X□□: Use this field when a length other than 3 m and 5 m is specified.

(Example X08 : 8m)

* The standard cable is a robot cable.

(5) Lead

Indicate the ball screw lead.

"Lead" refers to the distance the slider will move when the ball screw rotates by one revolution.

The larger the lead, the faster the maximum speed becomes.

(7) Applicable controller

Indicate the type of controller that can be used with the actuator.

T1: X-SEL-KE/KT, E-CON

T2: X-SEL-P/Q, S-SEL, S-CON

(9) Actuator Accuracy

Indicate a desired option(s) to be equipped on the actuator. Refer to pages 11 and 12 for the explanation of each option.

* When selecting multiple options, specify them in alphabetical order (e.g., AQ-B-L-NM).

AQ : [AQ seal] A unit that supplies lubricant to the sliding sections of the ball screw and guide.

B : [Brake] A brake for preventing the slider from falling in a vertical application when the power or servo is turned off.

C : [Creep sensor] A sensor for increasing the homing speed and thereby decreasing the homing time.

CL : [Creep sensor on opposite side] The creep sensor is normally installed on the right side as viewed from the motor.
Select this option if you want to install the sensor on the left side.

L : [Home limit switch] A limit switch for completing homing by reversing the slider using a sensor, not by the normal contact method, during homing.

LL : [Home limit switch on opposite side] Similarly to the creep sensor on opposite side option, select this option if you want to install the limit switch on the opposite side.

LM : [Master-axis designation] Specify this option for the axis to be used as the master in synchronized operation.

S : □
required).

LLM : [Ma

master axis used in synchronized operation.

NM : [Reverse-homing specification] Normally the home is set on the motor side. Select this option to specify the home on the counter-motor side.

RT : [Guide with ball-retaining mechanism] A mechanism for reducing noise while extending the service life of the guide by inserting a spacer (retention device) between guide balls.

EU : [Metal cablejoint connector] Select this option for a motor/encoder cable with metal cable plugs (see page 13).

Without this option plastic plugs are default. By this option cable lengths to 5 m are without surcharge, too.

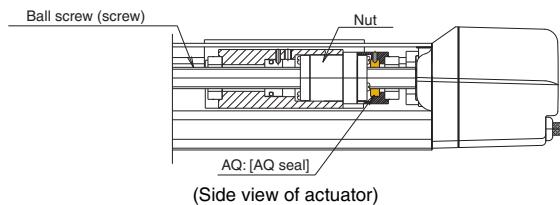

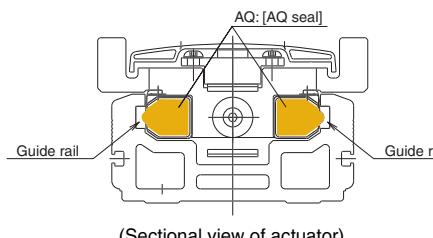

Options

AQ: [AQ seal]

The AQ seal is a lubrication unit that utilizes lubrication material made of resin-solidified lubricant.

The porous material impregnated with a large amount of lubricant allows lubricant to ooze out onto its surface via the capillary effect.

Lubricant is supplied when the AQ seal is pushed against the guide or ball-screw surface (steel-ball rolling surface). Combined use of the AQ seal and grease helps achieve maintenance-free operation for a long period.

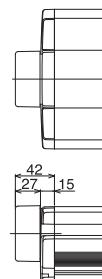

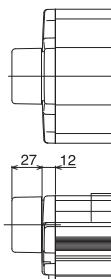

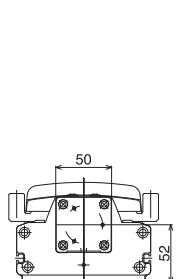

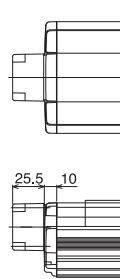

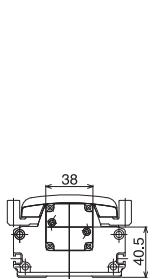

B: [Brake]

A retention mechanism that prevents the slider from falling and damaging the load when the power or servo is turned off in a vertical actuator application.

The S, M and L-type Z-axis actuators of the ISA/ISPA Series (SZM, MZM and LZM) are designed for use in a vertical application and therefore come standard with a brake.

If any axis other than the Z-axis is to be used vertically, install an optional brake.

For the S, M and L types, the brake is installed on the outside of the end cover on the counter-motor side (refer to the drawing of each model). The brake is installed inside the actuator only for the W type.

(S type)

(M type)

(L type)

C: [Creep sensor]

A sensor used for achieving high-speed homing.

Normally during homing, the slider is caused to contact the stopper at the motor-side stroke end and then reverse, so the homing speed is kept to between 10 and 20 mm/s.

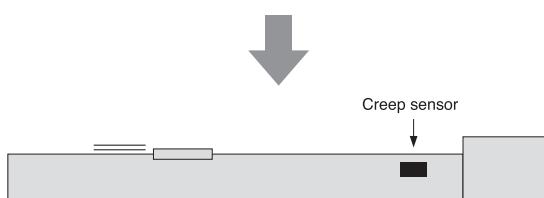

For this reason, it takes time to complete homing when the stroke is long. This proximity sensor reduces the homing time by allowing the slider to return at high speed and then reducing the speed to the normal homing speed just before homing is completed.

The standard installation position of this sensor is on the right side of the actuator as viewed from the motor (option code: C) (refer to the limit switch drawing on the right page).

A cover similar to that for the limit switch is provided on the outside of the sensor. To install the sensor on the opposite side, select CL (opposite side specification).

Performing homing on a long-stroke axis will take longer time to reach the mechanical end.

A sensor is provided before the mechanical end, and upon detection of the sensor the speed will be reduced to the normal homing speed.

Options

LL: [Home limit switch on opposite side]

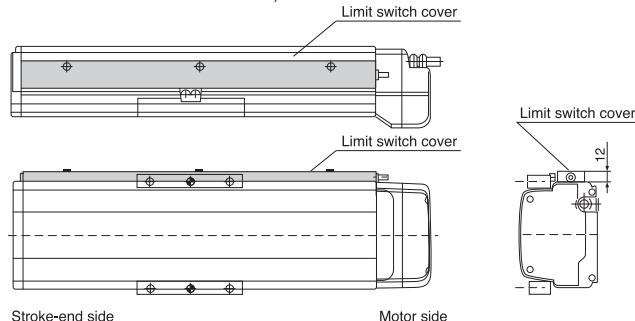

The normal homing operation of the ISA/ISPA Series conforms to the "contact method," whereby the slider is caused to contact the stopper and then reverse, after which the Z phase will be detected and set as the home.

Option L (home limit switch) achieves this homing operation by letting the slider reverse upon proximity sensor detection, without contacting the stopper. When this option is specified, three proximity sensors of HOME (for home detection), +OT (counter-motor side overtravel) and -OT (motor-side overtravel) will be installed. Use this option if you want to fine-tune the reversing position.

The standard installation position of the home limit switch and cover is on the right side of the actuator as viewed from the motor (option code: L).

To install the switch on the opposite side, select LL (opposite side specification).

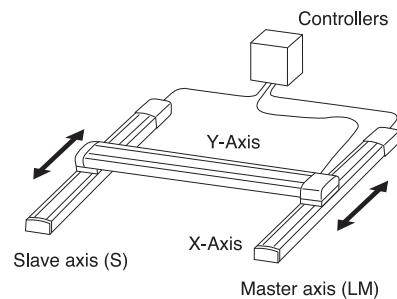

*The ISP-W and ISPDCR-W come standard with a limit switch. Since the limit switch is installed inside the actuator, no cover will be provided on the side face of the actuator (creep sensor is also housed in the actuator).

LM: [Master-axis designation in synchronized operation]

"Synchronized operation function" is one of the functions provided by the X-SEL controller.

It allows two actuator axes to operate simultaneously, with one axis acting as the master (option code: M) and the other as the slave (option code: S). The slave follows the master by super-high speed processing control to achieve simultaneous operation of the two axes. The two actuator axes used in synchronized operation must have the same specifications (type, lead motor output and stroke). When performing synchronized operation, the master axis must be of the limit switch specification. Therefore, specify LM (limit-switch master-axis designation) for the master axis and S (slave-axis designation) for the slave axis.

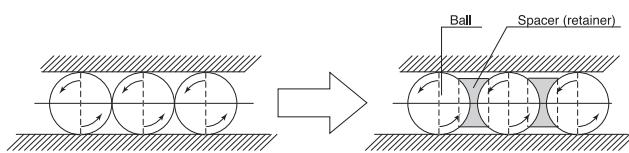

NM: [Reverse homing specification]

With the ISA/ISPA Series, the standard home direction is the motor side. To change the home direction, the encoder must be adjusted. If you prefer a reverse homing specification, specify it when placing an order.

RT: [Guide with ball-retaining mechanism]

A spacer (retainer) is inserted between guide balls (steel balls) to reduce noise while extending the service life of the guide. The spacer eliminates annoying metal noise caused by colliding balls.

Since wear due to ball friction decreases, the service life of the guide will increase. Elimination of ball contact will make the guide movement smoother, resulting in improved slider operability.

S: [Slave-axis designation in synchronized operation]

Specify this option for the axis to be used as the slave in synchronized operation. Refer to the explanation of LM (master-axis designation in synchronized operation) for details.

* The WXMX type comes standard with home limit switch (code: L).

Common Specifications

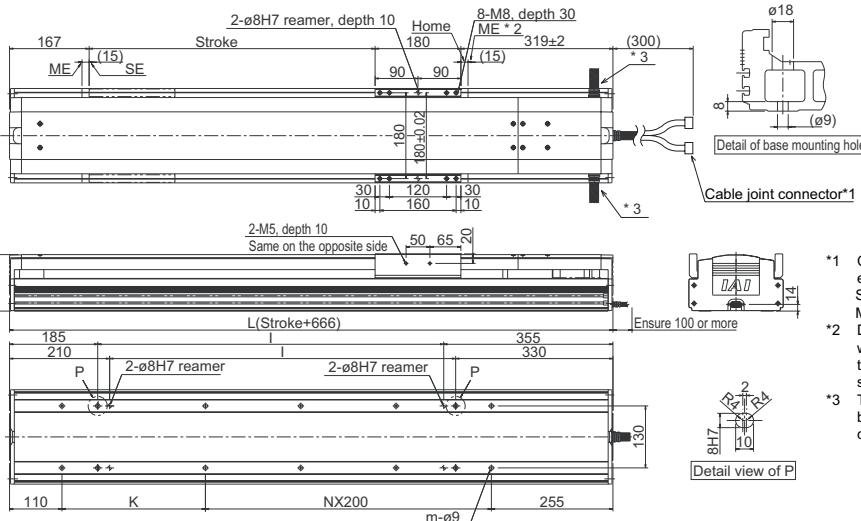

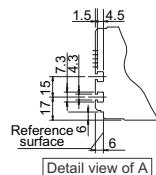

* The specifications of the ISPA are shown in [].

Positioning repeatability	±0.02mm [±0.01mm]
Drive system	Ball screw ø20mm, equivalent to rolled C10 [equivalent to C5]
Backlash	0.05mm or less [0.02mm or less]
Guide	Integrated with base
Allowable load moment	Ma: 139.2N · m, Mb: 199.9N · m, Mc: 391N · m
Overhang load length	Ma/Mb/Mc directions: 900mm or less
Base	Material: Aluminum with white alumite treatment
Applicable controller	T1: XSEL-KE/KT, E-Con, P-Driver, T2: XSEL-P/Q
Cable length (Note 3)	N: No cable, S: 3m, M: 5m, X□□: Length specification
Ambient operating temperature/humidity	0~40°C, 85% RH (non-condensing)

Dimensions

* To change the home direction, the actuator must be returned to IAI for adjustment.

* Due to their structure, the mid-support type cannot be positioned horizontally on their side, or in the vertical direction.

- *1 Connect the motor cable and encoder cable here.
SE: Stroke end
ME: Mechanical end
- *2 During home return, the slider will move to the ME, so be careful to prevent contact with surrounding parts.
- *3 The cable outlet direction can be changed to right or left at the customer's site.

Technical Information

How to Calculate Positioning Time

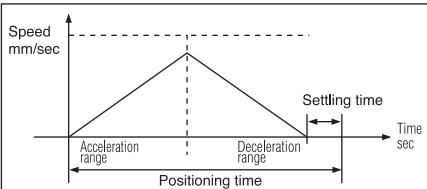

Positioning time of the actuator can be calculated.

The following two operation patterns are applicable depending on the travel distance and acceleration/deceleration condition.

A Trapezoid pattern

B Triangular pattern

First, check whether the operation in question conforms to the trapezoid pattern or triangular pattern and then calculate positioning time using the applicable equation.

How to Determine Operation Pattern

Whether an operation conforms to the trapezoid pattern or triangular pattern can be determined by identifying if the attained speed is higher or lower than the specified speed when the actuator is operated over the target travel distance at the specified acceleration.

$$\begin{aligned} \text{Attained speed } &= \sqrt{\text{Travel distance (Smm)} \times \text{Specified acceleration}} \\ &= \sqrt{\text{Smm} \times 9,800 \text{mm/sec}^2} \times \text{Acceleration setting (G)} \end{aligned}$$

One of the following two results will be obtained:

Specified speed (V) < Attained speed (Vmax)

----- Trapezoid pattern

Specified speed (V) > Attained speed (Vmax)

----- Triangular pattern

How to Calculate Positioning Time

A Trapezoid pattern

$$\text{Positioning time (T)} = \frac{\text{Distance (mm)}}{\text{Speed (mm/sec)}} + \frac{\text{Speed (mm/sec)}}{\text{Acceleration (mm/sec}^2)} + \text{Settling time}$$

B Triangular pattern

$$\text{Positioning time} = 2\sqrt{\frac{\text{Distance (mm)}}{\text{Acceleration (mm/sec}^2}}} + \text{Settling time}$$

$$\text{Acceleration time} = \frac{\text{Speed* (mm/sec)}}{\text{Acceleration (mm/sec}^2)}$$

Travel time during acceleration =

$$\frac{\text{Acceleration (mm/sec}^2) \times (\text{Acceleration time (sec)})^2}{2}$$

* Use the specified speed for the trapezoid pattern and attained speed for the triangular pattern.

Note

- Obtain acceleration by multiplying the controller's acceleration/deceleration setting (G) by 9800 mm/sec². If the controller's acceleration/deceleration setting is 0.3 G, acceleration is calculated as 0.3 × 9800 mm/sec² = 2940 mm/sec².
- Settling time is a period used for determining if the operation to the target position has completed. Normally a settling time of approx. 0.15 sec should be considered for a ball-screw type and 0.2 sec, for a belt type.

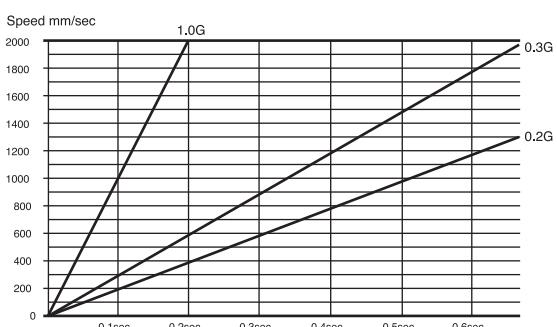

Positioning Time

Specified acceleration	Specified speed	Travel distance (mm)

Acceleration Time

ISA/ISPA Series Table of Load Capacity by Acceleration Condition

- Caution**
- The load capacity values shown below are provided for reference purposes only. They are not guaranteed and must therefore be used only as guidelines.
 - Even when the acceleration is below the rated acceleration, the load capacity will not increase beyond the load capacity at the rated acceleration.
 - Use models other than those in the ISA/ISPA Series at accelerations below their rated acceleration
